

WHITE PAPER

How to succeed in sending very large files over Internet?

One.Two..Three...Go >>>

*"123Go is a PC to PC file transfer program free from FTP.
The files, whatever size, are transferred directly from one
computer to another."*

July-August 2008

PRESENT DAY SCENARIO

“A number of files are too big to be sent via e-mail. Not everyone has access to FTP (File Transfer Protocol) servers. What to do then?”

Contemporary Solution: You burn the files on a CD/DVD and then courier it.

But this takes at least a day or two to reach the destination but you don't have this much time...so what then? Before discussing the solution, let's visit few present-day scenarios.

OTHER SCENARIOS

SCENARIO #1: As a professional working in an organization, you have some responsibilities of sending the official files, quickly. Considering the fast-moving world, you need to deliver the critical files to your client. “Faster solution to the client” is the need of the hour, else your business suffers. In this case, sending it via Courier may not be the best solution!!!

SCENARIO #2: You need to send a file to your friend so you open your e-mail program, type the message and attach the file but what is this!!! Your email program can't send the file because your email server does not allow sending very large files. Sometimes, you can attach a 20MB file to your email. But what to do if want to send a file over 100MB or 500MB or 1GB or more?

SCENARIO #3: The file is really big, over 100GB or more so you split it into smaller files and send these multiple files via email. But this takes a lot of time, patience, and energy. At the other end, the recipient has to download each file, put all of them together to get the 100GB or even larger file back in one piece!!! Whew...

SCENARIO #4: You have completed the project and need it to be sent over to the client but the project file is huge and cannot send it via email. Neither have you time for courier, so what now.....

SCENARIO #5: You have multiple large files to transfer. In this case, you cannot use email program at all. The finest solution could be FTP (File Transfer Protocol) server from where the recipients can download them but the problem is that you do not have access to any FTP server. You may consider setting one up from scratch but it could be time consuming and just to transfer files, it may not be sensible to set up

an FTP server. It is also possible that you may not be a technical person and will have to seek someone's services.

There could be more and more scenarios, where people might be facing similar problems while transferring files over 20MB and the large files.

POSSIBLE SOLUTION TO THESE PROBLEMS?

Considering the above scenarios, you could be looking for a single solution that could be easily available right on your desktop, to solve your file transfer problems. You need a solution that can solve these issues and facilitate sending and receiving the files at your own convenience.

You need a solution to meet your following requirements:

- Must be easy to install.
- Must be easy to navigate.
- Must be easy to use.
- Must be capable of transferring the files PRIVATELY.
- Must facilitate sending and receiving small as well as very large files.
- Must protect your files from falling into wrong hands.
- Must not have any max limit on the file size.
- Must allow sending unlimited files per month and must not restrict huge data transfer.
- Must facilitate resume of the pending files in case you cancel the file transfer when something urgent comes up that need your attention/presence.
- Must be cost effective...in case you need to transfer thousands of GB.
- Can be used from your home, office or when you are on the move.
- Must not expose files to others if you are transferring to someone on your LAN.
- Must be free from FTP.
- Must be free from email attachments.
- Must not host your files anywhere in the middle to protect your privacy.
- Must transfer the files directly to any computer that is connected to Internet.
- Must be Safe, Secure to use.
- Must eliminate the need of courier service, email attachments, FTP server.

So, is there a solution that can address all of the above mentioned issues?

YES!!!

123Go is a PC to PC file transfer program free from FTP. The files, whatever size, are transferred directly from one computer to another. Run **123Go** on both PC's to connect and transfer Documents, DVDs, Databases, Pictures, Audio Files, anything however small or BIG it is!!! 123Go v2.5 supports 16000GB single file transfer.

This incredibly powerful program facilitates sending and receiving small as well as very large files, of any size. It eliminates the need of FTP server and email attachments.

You just need an Internet connection and **123Go**. It enables you send any type of data safely to any PC, anywhere in the world. It is the secure mode of transferring any data because the data transfer is direct so no one can enter this secure line that makes **123Go** complete and secure mode of transferring data.

It will also let you know your IP addresses, Local (for use on LAN) and Global for Internet transfer. For better management of files transferred, **123Go** has a log feature which will help you know about what files did you send/receive, from what IP, the date/time and so on.

Indeed, **123Go** is an excellent, uncomplicated program for Companies, Students, Professionals, Designers, Entertaining Industry, or anyone who need to transfer small and large files without using any email service, online web-services, etc.

It is very easy to use and is a very secure mode of transferring data.
